

Chapter-3: Configuration

CONTENT

1. Introduction
2. Changing parameters in your programs
3. Updating the parameter file
4. The simple server configuration example
5. Installing modules from PGXN
6. MVCC
7. Conclusion

Introduction(1/1)

- **Reading the fine manual (RTFM)** is often (rudely) used to mean don't bother me; I'm busy, or it is used as a stronger form of abuse.
- The PostgreSQL documents are written in **Standard Generalized Markup Language (SGML)**, which is similar to, but not the same as, XML..

```
psql -U postgres -c 'SHOW config_file'
```

Or

```
sudo -u postgres psql -c 'SHOW config_file'
```

```
# Database administrative login by Unix domain socket
local  all          postgres      peer

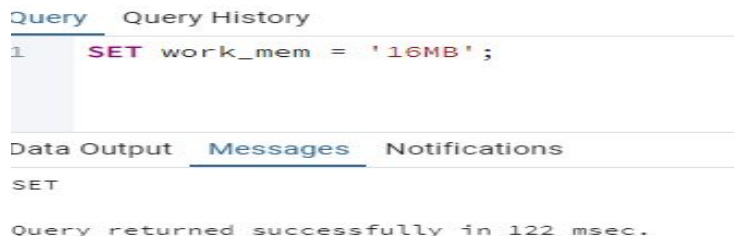

# TYPE  DATABASE  USER  ADDRESS  METHOD
host    all        all    0.0.0.0/0  md5
host    all        all    :/0       md5

# "local" is for Unix domain socket connections only
local  all        all                peer
```

Changing parameters in your programs(1/2)

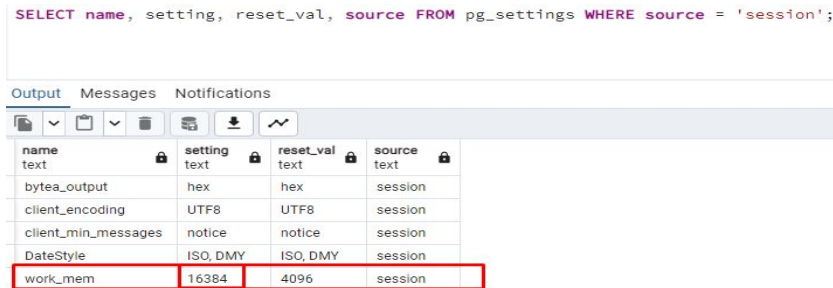

- You can change the value of a setting during your session, like this:

```
SET work_mem = '16MB';
```

The screenshot shows a database client interface with tabs for 'Query', 'Query History', 'Data Output', 'Messages', and 'Notifications'. The 'Query' tab is active, displaying a single query: `SET work_mem = '16MB';`. Below the query, the 'Messages' tab is active, showing the text 'SET' and 'Query returned successfully in 122 msec.'

```
select name, setting, reset_val, source from pg_settings where  
source = 'session'
```

The screenshot shows a database client interface with tabs for 'Output', 'Messages', and 'Notifications'. The 'Output' tab is active, displaying the results of the query `SELECT name, setting, reset_val, source FROM pg_settings WHERE source = 'session';`. The results are shown in a table with columns: name, setting, reset_val, and source. The row for 'work_mem' is highlighted with a red border.

name	setting	reset_val	source
bytea_output	hex	hex	session
client_encoding	UTF8	UTF8	session
client_min_messages	notice	notice	session
DateStyle	ISO, DMY	ISO, DMY	session
work_mem	16384	4096	session

Changing parameters in your programs(2/2)

- This value will then be used for every future transaction. You can also change it only for the duration of the current transaction:

```
BEGIN;
```

```
SET LOCAL work_mem = '16MB';
```

- The setting will last until you issue this command:

```
RESET work_mem;
```

```
postgres=# SELECT name, setting, reset_val, source FROM pg_settings WHERE  
source = 'session';
```

name	setting	reset_val	source
work_mem	4096	4096	session

- Alternatively, you can issue the following command:

```
RESET ALL;
```

Updating the parameter file(3/n)

- Follow these steps to set parameters at various levels as per the requirements:

1. For all users in the saas database, use the following commands:

```
ALTER DATABASE saas SET configuration_parameter =  
value1;
```

2. For a user named simon connected to any database, use the following commands:

```
ALTER ROLE simon SET configuration_parameter = value2;
```

3. Alternatively, you can set a parameter for a user only when they're connected to a specific database, as follows:

```
ALTER ROLE simon IN DATABASE saas SET  
configuration_parameter = value3;
```

The simple server configuration example(1/4)

- PostgreSQL konfiguratsiyasi qanday bo`lgani maqul?
- Qanday bo`lsa eng optimal yechim bo`ladi degan savollar katta ko`pchilik programmistlarni qiynaydi. Ayrimlar bor umuman bu narsaga qiziqib ham ko`rmay bazani o`rnatgan paytidagi konfiguratsiya bilan tiklab qo`yaveradi va faqat application tomondan optimizatsiya bilan shugullanadi.
- Lekin, server hardware va clientlar bazasi oqimidan va sizga qo`yilgan talablardan kelib chiqib, asosiy bo`lgan konfiguratsiyalarni sozlash mumkin.
- Buning uchun sizga open source PgTune (<https://github.com/leopard/pgtune>) bor.
- Hohlasangiz shu open sourceni ko`tarib o`zingiz tekshiring yoki tayyor ko`tarilganlardan foydalaning 📌. (https://t.me/postgresqluz_community)

The simple server configuration example (2/4)

 **PGTune**

Parameters of your system

DB version	<input type="text" value="16"/>	what is this?
OS Type	<input type="text" value="Linux"/>	what is this?
DB Type	<input type="text" value="Web application"/>	what is this?
Total Memory (RAM)	<input type="text" value="64"/> <input type="text" value="GB"/>	what is this?
Number of CPUs	<input type="text" value="12"/>	what is this?
Number of Connections	<input type="text" value="1000"/>	what is this?
Data Storage	<input type="text" value="SSD storage"/>	what is this?
<input type="button" value="Generate"/>		

postgresql.conf

ALTER SYSTEM

Add/modify this settings in **postgresql.conf** and restart database

```
# DB Version: 16
# OS Type: linux
# DB Type: web
# Total Memory (RAM): 64 GB
# CPUs num: 12
# Connections num: 1000
# Data Storage: ssd

max_connections = 1000
shared_buffers = 16GB
effective_cache_size = 48GB
maintenance_work_mem = 2GB
checkpoint_completion_target = 0.9
wal_buffers = 16MB
default_statistics_target = 100
random_page_cost = 1.1
effective_io_concurrency = 200
work_mem = 4194kB
huge_pages = try
min_wal_size = 1GB
max_wal_size = 4GB
max_worker_processes = 12
max_parallel_workers_per_gather = 4
max_parallel_workers = 12
max_parallel_maintenance_workers = 4
```

The simple server configuration example(4/4)

PGTune

More information about "**DB Type**" setting:

- Web Application (web)
 - Typically CPU-bound
 - DB much smaller than RAM
 - 90% or more simple queries
- Online Transaction Processing (oltp)
 - Typically CPU- or I/O-bound
 - DB slightly larger than RAM to 1TB
 - 20-40% small data write queries
 - Some long transactions and complex read queries

The simple server configuration example(5/4)

PGTune

- Data Warehouse (dw)
 - Typically I/O- or RAM-bound
 - Large bulk loads of data
 - Large complex reporting queries
 - Also called "Decision Support" or "Business Intelligence"
- Desktop application
 - Not a dedicated database
 - A general workstation, perhaps for a developer
- Mixed type of application
 - Mixed DW and OLTP characteristics
 - A wide mixture of queries

Installing modules from PGXN (1/5)

The **PostgreSQL Extension Network**, **PGXN** for short, is a website (<http://pgxn.org>) that was launched in late 2010 with the purpose of providing a central distribution system for open source PostgreSQL extension libraries.

Installing modules from PGXN (2/5)

Each extension has a unique name, so it is just a matter of issuing the following command:

```
CREATE EXTENSION myextname;
```

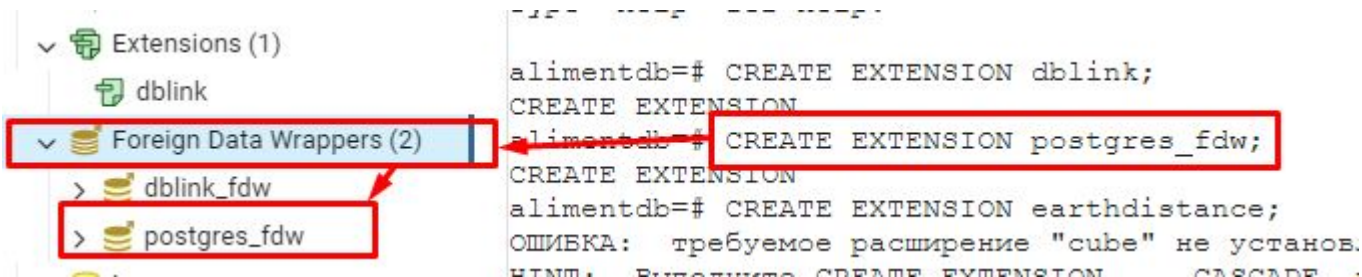

```
CREATE EXTENSION dblink;
```

Installing modules from PGXN (3/5)

The **postgres_fdw** module provides the foreign-data wrapper **postgres_fdw**, which can be used to access data stored in external PostgreSQL servers. The functionality provided by this module overlaps substantially with the functionality of the older **dblink** module. But **postgres_fdw** provides more transparent and standards-compliant syntax for accessing remote tables, and can give better performance in many cases.

```
CREATE EXTENSION postgres_fdw;
```

MVCC (2/2)

BEGIN TRANSACTION;

SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;

SELECT *pin*

FROM *aliment*

WHERE *id* = 1;

UPDATE

aliment

SET *pin* = '12'

WHERE *id* = 1;

COMMIT;

CONCLUSION(1/7)

Try to match the Postgresql config files as much as possible.
Postgres gives us a lot and we need to be able to use it properly. During this presentation, I gave brief information.
